Business Continuity (“Uptime”) with – BizCon6061

Why BizCon6061?

Backup - Disaster recovery - Business Continuity

For many IT departments, these terms are synonymous with backing up to tape, an external hard drive or perhaps online backup procedures. In truth, that’s just a backup! Offsite copies - maybe it’s the start of a disaster recovery plan. Supporting business continuity is what senior managers should really be looking at.

With BizCon6061, we are talking “UPTIME”

**Blue Chip Business Continuity
WITHOUT Blue Chip Prices**

BizCon6061 What is it?

At the heart of the BizCon6061 solution is a sophisticated network attached storage device for Windows servers. Deployed onsite, it comes pre-loaded with all the backup and virtualisation software needed to protect your business. BizCon6061 is a perfect complement or replacement to existing tape backups because of its ability to provide near real-time recovery from a single file, database or mail message, up to a full production server - in minutes!

What does it do?

Backup and Recovery

By taking snapshots of each server, as often as every 15 minutes, our solution eliminates the time-wasting tasks of tape recovery. In addition, because it uses block level replication (recovers at the binary code level) you have added protection against corrupted open files or databases. BizCon6061 brings simplicity to recovering data.

Standby Server

The instant virtualisation capability means that the device can be configured to function as a standby server within minutes. This means that RPO (recovery point objective) and RTO (recovery time objective) requirements are delivered in the optimum period. BizCon6061 virtualises servers directly from the backup image, without any need to convert backup images to virtual hard disks.

Bare Metal Restore

This gives you the ability to restore to a virtual server or dissimilar hardware configuration for ease of recovery after a disaster - e.g. hardware failure. It provides flexibility for restoration and doesn’t involve the cost and effort of keeping a standby server available.

Mailbox and Message Level Recovery

E-mail has become the lifeblood of the business world. BizCon6061 enables you to perform mailbox and message restorations faster than ever. With short recovery times and frequent recovery points, setbacks are fewer and employees are able to stay connected and productive, whether it is a failed Exchange server or a mistakenly deleted e-mail.

Unit-to-Unit Replication

What happens in a real disaster? BizCon6061 supports unit-to-unit replication, by placing one device on your main network and another device at a separate office or data centre. Data is replicated between the two devices. In the event of a disaster, the second unit can be used as a standby server or to restore all data to new hardware.

Risk Management

BizCon6061 can complement or replace your existing backup procedures. The in-built Dashboard enables network managers to monitor processes, configure alerts, view reports, perform test restores and, perhaps most importantly, prove to senior managers and auditors that business continuity arrangements are in place, working and can be clearly demonstrated.
